Representation comparison

All three are classical numerical models. Relative performance is UNKNOWN.

QLC	PSC	TEC
State: Density operator rho	State: Purified joint slot tensors	State: Weighted persistent rays
Test: Operational off-diagonals	Test: Cross-slot dependence budget	Test: Information beyond rho
Classical rival: HQMM / OOM, real vector	Classical rival: Joint mixture, graph, tensor	Classical rival: Equally informed particles
Priority: Baseline / decisive test	Priority: First conditional pilot	Priority: Deferred

Passing a mechanism test does not establish novelty or matched-compute advantage.

All empirical gates: NOT RUN. Recommendation is an inference from prior art and testability.
